

SUMMARY
SPHERICAL SUPPORT

The invention relates to movable support devices usable, in particular, in engineering industry, furniture production etc.

Use of a support which can be fixed and adjusted relative to a floor due to a ring plug movable relative to the axis of a case expands significantly the fields where the spherical support is usable. A plug and a case can be connected and fixed by different ways, such as thread connection or pneumatic actuator as well as use of a rotary support axial bearing having a spherical surface of contact with a plug, and such a diversity offers various effective versions of manufacturing and operation of the support.
